~~Monday~~

Second Order P.D.E.

A P.D.E with variable coefficients will be called of second order, if it contains at least one partial derivative of 2nd order and none of the order higher than the second.

With standard symbols

$$\left. \begin{aligned} p &= \frac{\partial z}{\partial x}, \quad q = \frac{\partial z}{\partial y}, \quad r = \frac{\partial^2 z}{\partial x^2} = \frac{\partial p}{\partial x}, \\ s &= \frac{\partial^2 z}{\partial x \partial y} = \frac{\partial p}{\partial y} = \frac{\partial q}{\partial x}, \quad t = \frac{\partial^2 z}{\partial y^2} = \frac{\partial q}{\partial y} \end{aligned} \right\} \textcircled{1}$$

where z is a dependent variable and x and y are two independent variables,

~~Tuesday~~

A second order P.D.E can be written as

$$Rx + Ss + Tt + Pp + Qq + Zz = f(x, y) \quad \text{---} \textcircled{2}$$

where R, S, T, P, Q, Z are functions of x and y only and not all R, S, T are zero.

This equⁿ may also be written as

$$Rx + Ss + Tt = V \quad \text{---} \textcircled{3}$$

where V is a funⁿ of x, y, z, p and q .

The general solⁿ of this equⁿ will contain two arbitrary fun^s.

When R, S, T are all constants, the equⁿ $\textcircled{3}$ will be called a second order P.D.E with constant-coefficients.

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30					

An equⁿ

$$a \frac{\partial^2 z}{\partial x^2} + b \frac{\partial^2 z}{\partial x \partial y} + c \frac{\partial^2 z}{\partial y^2} = 0 \quad \text{--- (1)}$$

where a, b, c are constants, will be called a second order ~~two~~ homogeneous partial differential equⁿ with ~~constant~~ constant co-efficients.

Classification of second order P.D.E:-

Let us consider a second order P.D.E, given by $Rr + Ss + Tt = f(x, y, z, p, q)$ --- (1) where R, S, T are either functions of x and y or constants.

This equⁿ (1) will be called Elliptic, Hyperbolic or Parabolic

Thursday

according as

$$S^2 - 4RT < 0, > 0 \text{ or } = 0 \text{ respectively.}$$

i.e., the equⁿ (1) will be

(i) Elliptic if $S^2 - 4RT < 0$

(ii) Hyperbolic if $S^2 - 4RT > 0$

and (iii) Parabolic if $S^2 - 4RT = 0$.

Solved Example:-

Q1. Determine the type of the equations

(a) $2 \frac{\partial^2 z}{\partial x^2} - 8 \frac{\partial^2 z}{\partial x \partial y} + 3 \frac{\partial^2 z}{\partial y^2} + 2 \frac{\partial z}{\partial x} = 0$

(b) $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial^2 z}{\partial x \partial y} + 2 \frac{\partial^2 z}{\partial y^2} = 0$

(c) $\frac{\partial^2 z}{\partial x^2} - 4 \frac{\partial^2 z}{\partial x \partial y} + 4 \frac{\partial^2 z}{\partial y^2} + 3 \frac{\partial z}{\partial y} = 0$

Sun	Mon	Tue	Wed	Thu	Fri	Sat
					1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30

Solⁿ - (a) With usual notations

$$R = 2, S = -8, T = 3$$

$$\text{Now, } S^2 - 4RT = (-8)^2 - 4 \cdot 2 \cdot 3 = 40 > 0$$

So this equⁿ is Hyperbolic.

(b) Here $R = 1, S = -2, T = 2$

$$\text{Now, } S^2 - 4RT = (-2)^2 - 4 \cdot 1 \cdot 2 = -4 < 0$$

So this equⁿ is Elliptic.

(c) Here $R = 1, S = -4, T = 4$

$$\text{Now } S^2 - 4RT = (-4)^2 - 4 \cdot 1 \cdot 4 = 0$$

So this equⁿ is Parabolic.

Q2. Classify the following P.D.E.

(a) $2 \left(\frac{\partial^2 z}{\partial x^2} \right) + 4 \left(\frac{\partial^2 z}{\partial x \partial y} \right) + 3 \frac{\partial^2 z}{\partial y^2} = 2$

(b) $\frac{\partial^2 z}{\partial x^2} + 4 \frac{\partial^2 z}{\partial x \partial y} + 4 \frac{\partial^2 z}{\partial y^2} = 0$

(c) $xyx - (x^2 - y^2)s = myt + py - qx = 2(x^2 - y^2)$

Solⁿ - (a) With usual notations

$$R = 2, S = 4, T = 3$$

$$\text{Now } S^2 - 4RT = 4^2 - 4 \cdot 2 \cdot 3 = -8 < 0$$

So this equⁿ is Elliptic.

(b) Here, $R = 1, S = 4, T = 4$

$$\text{Now } S^2 - 4RT = 4^2 - 4 \cdot 1 \cdot 4 = 0$$

So this equⁿ is Parabolic.

2018

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30					

(c) Here $R = xy$, $S = -(x^2 - y^2)$, $T = -xy$.

$$S^2 - 4RT = \{-(x^2 - y^2)\}^2 - 4 \cdot xy \cdot (-xy)$$

$$= (x^2 - y^2)^2 + 4xy^2$$

$$= (x^2 + y^2)^2 > 0.$$

So this eqn is Hyperbolic.

Problem:-

Q. Classify the types of the following eqns.

(a) $\frac{\partial^2 z}{\partial x^2} - \frac{4 \partial^2 z}{\partial y^2} = 0$

(b) $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} - \frac{\partial z}{\partial x} + z = 0$

(c) $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} + 5 \frac{\partial z}{\partial x} + z = 0.$

(d) $\frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + y \frac{\partial^2 z}{\partial y^2} - xy \frac{\partial z}{\partial y} + z = 0.$
