# Partial Differential Equation.

## ① Derivation of a Partial Differential Equ.

Partial differential equ<sup>n</sup> can be formed in two ways: (a) by the elimination of arbitrary constants and (b) by the elimination of arbitrary functions.

### 1. Formation by eliminating arbitrary constants

Let  $\phi(x, y, z, a, b) = 0$  be any relation between two independent variables  $x, y$  and a dependent variable  $z$  and together with two arbitrary constants  $a$  and  $b$ .  
Diff<sup>n</sup> ① partially w.r.t  $x$  and  $y$ , we get

$$\frac{\partial \phi}{\partial x} + \frac{\partial \phi}{\partial z} \cdot \frac{\partial z}{\partial x} = 0 \quad \text{or,} \quad \frac{\partial \phi}{\partial x} + p \frac{\partial \phi}{\partial z} = 0.$$

$$\text{and} \quad \frac{\partial \phi}{\partial y} + \frac{\partial \phi}{\partial z} \cdot \frac{\partial z}{\partial y} = 0 \quad \text{or,} \quad \frac{\partial \phi}{\partial y} + q \frac{\partial \phi}{\partial z} = 0.$$

Now eliminating two quantities  $a$  and  $b$  from these relations ①, ② and ③, we get a P.D.E. of first order as

$$f(x, y, z, p, q) = 0.$$

Notes:- Standard notations are:

$$p = \frac{\partial z}{\partial x}, \quad q = \frac{\partial z}{\partial y}, \quad r = \frac{\partial^2 z}{\partial x^2}, \quad s = \frac{\partial^2 z}{\partial x \partial y} \quad \text{and} \quad t = \frac{\partial^2 z}{\partial y^2}.$$

2018

| Sun | Mon | Tue | Wed | Thu | Fri | Sat |
|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     | 1   | 2   | 3   |
| 4   | 5   | 6   | 7   | 8   | 9   | 10  |
| 11  | 12  | 13  | 14  | 15  | 16  | 17  |
| 18  | 19  | 20  | 21  | 22  | 23  | 24  |
| 25  | 26  | 27  | 28  | 29  | 30  | 31  |

2. By the elimination of two arbitrary functions.

Let us consider a relation between two functions  $u$  and  $v$  as given by  $\Phi(u, v) = 0$ . — (1)  
 where  $u$  and  $v$  are two functions of  $x, y, z$ ;  
 $x, y$  being two independent variables  
 and  $z$  being a dependent variable.  
 Now, differentiating (1) partially w.r.t  $x$   
 and  $y$ , we get.

$$\frac{\partial \Phi}{\partial u} \left( \frac{\partial u}{\partial x} + \frac{\partial u}{\partial z} \frac{\partial z}{\partial x} \right) + \frac{\partial \Phi}{\partial v} \left( \frac{\partial v}{\partial x} + \frac{\partial v}{\partial z} \frac{\partial z}{\partial x} \right) = 0.$$

$$\text{or, } \frac{\partial \Phi}{\partial u} \left( \frac{\partial u}{\partial x} + p \frac{\partial u}{\partial z} \right) + \frac{\partial \Phi}{\partial v} \left( \frac{\partial v}{\partial x} + p \frac{\partial v}{\partial z} \right) = 0$$

4

Wednesday

$$\text{and } \frac{\partial \Phi}{\partial u} \left( \frac{\partial u}{\partial y} + q \frac{\partial u}{\partial z} \right) + \frac{\partial \Phi}{\partial v} \left( \frac{\partial v}{\partial y} + q \frac{\partial v}{\partial z} \right) = 0.$$

Now eliminating  $\frac{\partial \Phi}{\partial u}$  and  $\frac{\partial \Phi}{\partial v}$  from (2) and (3) we get

$$\begin{vmatrix} \frac{\partial u}{\partial x} + p \frac{\partial u}{\partial z} & \frac{\partial v}{\partial x} + p \frac{\partial v}{\partial z} \\ \frac{\partial u}{\partial y} + q \frac{\partial u}{\partial z} & \frac{\partial v}{\partial y} + q \frac{\partial v}{\partial z} \end{vmatrix} = 0$$

$$\text{or, } \left( \frac{\partial u}{\partial x} + p \frac{\partial u}{\partial z} \right) \left( \frac{\partial v}{\partial y} + q \frac{\partial v}{\partial z} \right) - \left( \frac{\partial v}{\partial x} + p \frac{\partial v}{\partial z} \right) \left( \frac{\partial u}{\partial y} + q \frac{\partial u}{\partial z} \right) = 0$$

$$\text{or, } \left( \frac{\partial u}{\partial x} \frac{\partial v}{\partial y} + \frac{\partial u}{\partial x} q \frac{\partial v}{\partial z} + p \frac{\partial u}{\partial z} \frac{\partial v}{\partial y} + p q \frac{\partial u}{\partial z} \frac{\partial v}{\partial z} \right) - \left( \frac{\partial v}{\partial x} \frac{\partial u}{\partial y} + \frac{\partial v}{\partial x} q \frac{\partial u}{\partial z} + p \frac{\partial v}{\partial z} \frac{\partial u}{\partial y} + p q \frac{\partial v}{\partial z} \frac{\partial u}{\partial z} \right) = 0$$

| Sun | Mon | Tue | Wed | Thu | Fri | Sat |
|-----|-----|-----|-----|-----|-----|-----|
|     |     | 1   | 2   | 3   | 4   | 5   |
| 6   | 7   | 8   | 9   | 10  | 11  | 12  |
| 13  | 14  | 15  | 16  | 17  | 18  | 19  |
| 20  | 21  | 22  | 23  | 24  | 25  | 26  |
| 27  | 28  | 29  | 30  | 31  |     |     |

which is of the form

$$Pp + Qq = R$$

where 
$$P = \frac{\partial u}{\partial y} \frac{\partial v}{\partial z} - \frac{\partial u}{\partial z} \frac{\partial v}{\partial y}$$

$$Q = \frac{\partial u}{\partial z} \frac{\partial v}{\partial x} - \frac{\partial u}{\partial x} \frac{\partial v}{\partial z}$$

$$R = \frac{\partial u}{\partial x} \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \frac{\partial v}{\partial x}$$

### ④ Solved Example

Q1. Obtain a P.D.E by eliminating  $a$  and  $b$  from the eqn<sup>n</sup>  $az + b = a^2x + y$ .

Sol<sup>n</sup>:- The eqn<sup>n</sup> is

$$az + b = a^2x + y \quad \text{--- (i)}$$

Diff<sup>n</sup> (i) partially w.r.t  $x$  and  $y$  we get

$$a \frac{\partial z}{\partial x} = a^2 \quad \text{--- (ii)}$$

$$\text{and } a \frac{\partial z}{\partial y} = 1 \quad \text{--- (iii)}$$

From (ii) and (iii), eliminating  $a$ , we get

$$\frac{\partial z}{\partial x} \cdot \frac{\partial z}{\partial y} = 1$$

$$\text{i.e., } pq = 1.$$

which is the required P.D.E.

Saturday

| Sun | Mon | Tue | Wed | Thu | Fri | Sat |
|-----|-----|-----|-----|-----|-----|-----|
| 4   | 5   | 6   | 7   | 1   | 2   | 3   |
| 11  | 12  | 13  | 14  | 15  | 16  | 17  |
| 18  | 19  | 20  | 21  | 22  | 23  | 24  |
| 25  | 26  | 27  | 28  | 29  | 30  | 31  |

Q2. Eliminate arbitrary constants from  $z = (x-a)^2 + (y-b)^2$  to form the P.D.E.

Sol<sup>n</sup>:- Diff<sup>n</sup> the given relation partially w.r.t.  $x$  and  $y$  separately we get,

$$\frac{\partial z}{\partial x} = p = 2(x-a) \quad \text{--- (1)}$$

$$\text{and } \frac{\partial z}{\partial y} = q = 2(y-b) \quad \text{--- (2)}$$

To eliminate  $a, b$  squaring and adding (1) and (2), we get,

$$p^2 + q^2 = 4[(x-a)^2 + (y-b)^2] \\ = 4z$$

Sunday

$$\text{or, } p^2 + q^2 = 4z$$

which is the required P.D.E.

Q3. Obtain the PDE which has its general sol<sup>n</sup>  $u = f(\sqrt{x^2 + y^2})$ , where  $f$  is an arbitrary function.

Sol<sup>n</sup>:- The eqn<sup>n</sup> is  $u = f(\sqrt{x^2 + y^2})$  --- (1)

Diff<sup>n</sup> (1) partially w.r.t.  $x$  we get

$$\frac{\partial u}{\partial x} = f'(\sqrt{x^2 + y^2}) \cdot \frac{x}{\sqrt{x^2 + y^2}} \quad \text{--- (2)}$$

Diff<sup>n</sup> (1) partially w.r.t.  $y$  we get

$$\frac{\partial u}{\partial y} = f'(\sqrt{x^2 + y^2}) \cdot \frac{y}{\sqrt{x^2 + y^2}} \quad \text{--- (3)}$$

| Sun | Mon | Tue | Wed | Thu | Fri | Sat |
|-----|-----|-----|-----|-----|-----|-----|
|     |     | 1   | 2   | 3   | 4   | 5   |
| 6   | 7   | 8   | 9   | 10  | 11  | 12  |
| 13  | 14  | 15  | 16  | 17  | 18  | 19  |
| 20  | 21  | 22  | 23  | 24  | 25  | 26  |
| 27  | 28  | 29  | 30  | 31  |     |     |

~~Monday~~

from (ii) and (iv) we get

$$y \frac{\partial u}{\partial x} = x \frac{\partial u}{\partial y}$$

which is the required P.D.E.

Q4. Eliminate the arbitrary fun  $\phi$  and  $\psi$  from  $z = \phi(x+iy) + \psi(x-iy)$ , where  $i^2 = -1$ .

Sol:- Here the equ<sup>n</sup> is  $z = \phi(x+iy) + \psi(x-iy)$  — (i)  
Diff<sup>n</sup> both sides of (i) partially w.r.t.  $x$  we get

$$\frac{\partial z}{\partial x} = \phi'(x+iy) + \psi'(x-iy)$$

again, diff<sup>n</sup> w.r.t.  $x$  partially we get,

$$\frac{\partial^2 z}{\partial x^2} = \phi''(x+iy) + \psi''(x-iy) \quad \text{--- (ii)}$$

Now diff<sup>n</sup> both sides of (i) partially w.r.t.  $y$  we get

$$\frac{\partial z}{\partial y} = i \phi'(x+iy) - i \psi'(x-iy)$$

Again diff<sup>n</sup> w.r.t.  $y$  partially we get

$$\begin{aligned} \frac{\partial^2 z}{\partial y^2} &= i^2 \phi''(x+iy) + i^2 \psi''(x-iy) \\ &= -\{ \phi''(x+iy) + \psi''(x-iy) \} \quad [\because i^2 = -1] \\ &= -\frac{\partial^2 z}{\partial x^2} \quad [\text{using (ii)}] \end{aligned}$$

$$\text{Therefore, } \frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = 0$$

which is the required P.D.E.

④ Solved the following problem.

1. Form the differential equation by eliminating  $a$  and  $b$  from  
 $z = (x^2 + a)(y^2 + b)$ .

2. Eliminate  $a, b$  and  $c$  from  
 $z = a(x+y) + b(x-y) + abt + c$ .

3. Form a partial differential equation by eliminating the fun<sup>n</sup>  
 $t$  from  $z = x f\left(\frac{y}{x}\right)$ .

④  Form a partial differential equation by eliminating the  
~~Thursday~~ arbitrary function from  
 $z = y^2 + 2f\left(\frac{1}{x} + \log y\right)$ .
